HTML + JavaScript Explanation Notes

HTML STRUCTURE The HTML document begins with the DOCTYPE declaration. The <html> tag defines the start of the webpage. Inside the head section, meta tags load character encoding, viewport settings, the page title, icon library, and Google Fonts. The body contains the navbar, home section, animated bars, and the about section. NAVBAR The navbar contains a logo and a list of navigation links. Each item uses <li> and <a> tags. The 'active' class is used to highlight the selected section. HOME SECTION Includes the name, animated job titles, description paragraph, and social icons. The right side holds the image box for the profile picture. ABOUT SECTION Uses two columns: one for the image and one for text. Tabs allow switching between Skills, Experience, and Education sections. JAVASCRIPT LOGIC JavaScript controls which tab content is visible. It collects all elements with the class 'tab-links' and 'tab-contents'. When a tab is clicked, the opentab function removes active classes from all tabs and applies them only to the clicked one. EVENT HANDLING event.currentTarget identifies the clicked tab element. document.getElementById(tabname) finds the matching content block and activates it by adding the 'active-tab' class.
